Why Do Agencies (sometimes) Get So Much Mail?
Lobbying coalitions, mass comments, and political information in bureaucratic policymaking

Devin Judge-Lord
JudgeLord@Wisc.edu

January 7, 2019

THIS DRAFT WAS PREPARED FOR SPSA 2019. THE MOST RECENT DRAFT IS HERE.

Abstract

Scholars of bureaucratic policymaking have focused on the sophisticated lobbying efforts of powerful interest groups. Yet agencies occasionally receive thousands or even millions of comments from ordinary people. Why? Why do individuals comment when they seemingly have no new information to offer and no power to influence decisions? Who inspires them and to what end? How, if at all, should scholars incorporate mass commenting into models of bureaucratic policymaking? I argue that mass commenting produces political information about the coalition that mobilized it. To link individual comments to the more sophisticated lobbying efforts they support, I use text reuse and topic models to identify clusters of similar comments, reflecting formal and informal coalitions. I also classify different types of supporters. Using these new measures of political mobilization and engagement in agency rulemaking, I identify the conditions under which mass comment campaigns occur and produce different types of politically-relevant information.

Contents

Note to reader:

Thank you so much for reading this draft dissertation chapter. For context, this is the first chapter developing a measure of public engagement in agency rulemaking that will be used in the following empirical chapters. In the dissertation, I argue that mass engagement results from interest groups' strategic choices. When lobbying organizations have an opportunity to shape policy, resources to mobilize, and broader support than their opposition, outside lobbying ("going public") may produce valuable, politically-relevant information. Depending on how agencies process political information, outside lobbying may influence policy, both directly and indirectly. For example, those lobbying in rulemaking often make suspect claims to represent broad segments of the public. Mobilizing a large number of people may directly support such claims. Indirectly, it may alert elected officials to political risks and opportunities, affecting oversight behavior.

Outline of the broader project

Does mass engagement in bureaucratic policymaking affect policy? This question drives my project. However, two questions must be answered first: (1) Why does it occur? and (2) How does it affect the oversight behaviors of agencies' political principals? These questions drive two initial empirical chapters. I then use my new measures of the political information that lobbying coalitions create by going public to test whether mass engagement explains variation in agency rulemaking and rules.

Part 1. Why do agencies (occasionally) get so much mail? Why do people comment on draft policies when they seem to have no new information to offer and no power to influence decisions? Who inspires them and to what end? Answering these questions requires a theory explaining variation in mass engagement and a method to link comments to the lobbying coalitions that mobilized them. To link individual comments to the more sophisticated lobbying efforts they support, I use text reuse and Bayesian classifiers to identify clusters of similar comments, reflecting formal and informal coalitions. I argue that activists' resources, opportunities, and public support explain variation in mass engagement and that it will fit one of three patterns: (1) Coalitions will "go public" when they are disadvantaged in insider politics but have more support than opposing coalitions. More public support yields more engagement, more effort per comment, and contagion beyond those mobilized directly. (2) Coalitions with less support may "counter-mobilize" with smaller effects. (3) Finally, coalitions may mobilize for reasons unrelated to the policy at hand, yielding similar mass engagement but with little sophisticated lobbying. Measures of mass engagement include (1) comments per coalition, (2) effort per comment, (3) share of comments per coalition mobilized indirectly (i.e. the potential for conflict spread). Next, I test whether variation in engagement explains variation in oversight behavior (step 2) and policy outcomes (step 3).

Part 2. Does mass engagement affect political oversight? The political information signaled by mass engagement may serve as a "fire alarm," altering principals to oversight opportunities or "warning signs" altering them to political risks. When a coalition goes public, principals ought to be more likely to engage on their behalf and less likely to engage against them. To assess these hypotheses, I count the number of times Members of Congress engage the agency before, during, and after comment periods on rules where lobbying organizations did and did not go public. I then use text analysis to compare legislators' sentiments and rhetoric to that used by each coalition. Dependent variables include (1) the number of comments from Members of Congress on the rule (2) the share of supportive congressional comments, (3) the similarity of words in comments from the coalition and Members of Congress.

Part 3. Does mass engagement affect rulemaking and rules? I theorize that the effects of political information on policy depend on the extent to which the strategic environment allows change and how political information is processed, both directly within agencies and indirectly through other actors (e.g. Members of Congress) whose appraisals matter to bureaucrats. The main dependent variable is change in the rule text. I systematically identify changes between draft and final rules, parse these differences to identify meaningful policy changes, and compare them to demands raised in comments to measure which coalition got their way. However, assessing policy change is difficult. Thus, I also use other measures of agency responses to lobbying efforts.

1   Introduction

Large democracies face two big problems. First, they are vulnerable to fleeting passions and demagogues. To combat this, many decisions are left to experts who, ideally, exercise judgment loosely guided by the public. Second, everyone cannot vote on every decision. Thus, power is delegated to representatives (who then delegate it to deputies), create temporary mini-publics, and solicit input from those most affected or moved by a public decision.[1] Most policy is then made by bureaucrats (West and Raso (2013) estimates that upward of 90% of legally binding U.S. federal policy is now written by agencies), supposedly guided indirectly through elected representatives and directly by limited public input (mostly limited to more contentious policy debates).

With the rise of the administrative state, U.S. federal agencies have become a major site of policymaking and political conflict. Agency rules are revised much more frequently than statutory law (Wagner et al. 2017) and in the years or decades between legislative enactments, federal agencies make legally-binding rules interpreting and reinterpreting old statutes to address emerging issues and priorities. Examples are striking: The effect of the Dodd-Frank Wall Street Reform and Consumer Protection Act was largely unknown until the specific regulations were written, and it continues to change as these rules are revised. Congress authorizes billions in farm subsidies and leases for public lands, but who gets them depends on agency policy. In the decades since the last major environmental legislation, agencies have written thousands of pages of new environmental regulations and thousands more changing tack under each new administration. These revisions significantly shape lives and fortunes. For example, in 2006, citing the authority of statutes last amended in the 1950s, the Justice Department's Bureau of Prisons proposed a rule restricting eligibility for parole. In 2016, the Bureau withdrew this rule and announced it would be requiring fewer contracts with private prison companies, precipitating a 50% loss of industry stock value. Six months later, a new attorney general announced these policies would again be reversed, leading to a 130% increase in industry stock value. Rulemaking clearly matters.

Less clear, however, is how the new centrality of agency rulemaking fits into a democracy. In addition the bureaucracy's complex relationships with the president and Congress, agencies have complex and poorly understood relationships with the public and advocacy groups. Relationships with constituent groups may even provide agencies with a degree of "autonomy" from their official principals (Carpenter 2001).

Processes like public comment periods are said to produce valuable technical information (Yackee 2006; Nelson and Yackee 2012), oversight opportunities (Balla 1998; Mccubbins and Schwartz 1984), and democratic legitimacy (Croley 2003; Rosenbloom 2003). There is no normative consensus on how to rank

---

[1] As imagined by Dahl (1989), mini-publics are representative, selected at random, and deliberative. Besides juries, however, randomly selected deliberative bodies are rare. Instead, citizens more often engage in government decisions when given opportunities to opt-in, such as hearings, petitions, and public comment periods. These mechanisms of engagement generate a different, more contentious flavor of public input than the discourse imagined by scholars who focus on deliberation.

or merge these aims (Wilson 1967, 1989; Carrigan 2017) in bureaucratic policymaking and procedures requiring agencies to solicit public input and the justification of these procedures cite all three aims. For example, these various goals are evident in the Administrative Conference of the United States (ACUS) Proposed Recommendation on Public Engagement in Rulemaking, which asserts that "The opportunity for public engagement is vital to the rulemaking process, permitting agencies to obtain more comprehensive information, enhance the legitimacy and accountability of their decisions, and enhance public support for their rules" (ACUS 2018). Public comment periods are purported to simultaneously produce technical information, accountability to elected officials, and responsiveness to public demands.

Yet, legitimacy, accountability, public support, and especially collecting information depend not just on the opportunity to engage but actual engagement (Herz 2018), and scholars have thus far focused on the participation of interest groups. We know surprisingly little about the input of ordinary people and the role it may or may not play in rulemaking.[2]

The contentious politics that inspire the majority of public comments have no place in leading models of bureaucratic policymaking and have largely been ignored by political scientists. Instead, models focus on how agencies either learn about policy problems, negotiate or avoid accountability to various principals, or balance interest-group demands.[3]

Foundational scholarship on rulemaking by Furlong and Kerwin (2004), Furlong (1997, 1998), and Kerwin and Furlong (2011) focuses on interest group lobbying. To the extent scholars address the input of ordinary people—i.e. not professional policy influencers—at all, both theory and empirical scholarship suggest skepticism that it matters. Empirical scholarship finds that economic elites and business groups dominate American politics in general (Gilens and Page 2014) and rulemaking in particular. While some are optimistic that requirements for agencies to solicit and respond to public comments on proposed rules allow "civil society" to provide public oversight (Michaels 2015; Metzger 2010), most studies find that participants in rulemaking often represent elites and business interests (Seifter 2016; Crow, Albright and Koebele 2015; Wagner, Barnes and Peters 2011; West 2009; Yackee and Yackee 2006; Yackee 2006; Golden 1998; Haeder and Yackee 2015; Cook 2017).

From a strategic perspective, agency officials are not directly accountable to voters. And even if

---

[2] But see Yackee (2015), who surveys commenters, finding that members of the public believe their comments matter, even though powerful groups have more influence; Cuéllar (2005), who examines public input on three rules, finding that ordinary people made up the majority of commenters; and Balla et al. (2018), who find significant participation from ordinary people in a case study of EPA rulemaking.

By "ordinary" people, I simply mean people who are not professional policy-influencers, not that these politically-engaged people are demographically representative of the broader public.

[3] On learning, see Kerwin and Furlong (2011) and empirical studies by Yackee (2012), Cook (2017), (Gordon and Rashin 2018), and Walters (2019). See Gailmard and Patty (2017) and Libgober (2018) for information-based models where comments reveal information to the agency.

On accountability to elected officials, see Furlong (1997), Nou and Stiglitz (2016), Potter (2016), Woods (2018), and Yackee and Yackee (2009). See Gailmard and Patty (2012) for a review of formal models of oversight. Especially relevant to my analysis below, Potter (2014) presents a signaling model where agencies propose and principals veto rules depending, in part, on their beliefs about interest group preferences.

On interest group balancing see Yackee and Yackee (2006), Yackee (2006), and Kerwin and Furlong (2011). A key assumption of Libgober's (2018) model is that bureaucrats have a distribution of preferences over interest group positions, about which they are uncertain unless groups reveal their preferences through commenting.

organized groups do supplement congressional and judicial checks on executive power, the groups that participate in rulemaking represent only certain (if any) segments of the public and may not represent them well (Seifter 2016). Scholars are thus skeptical about rulemaking as a site for collective action the ability of most people to participate. As a result, mass comment campaigns are dismissed as epiphenomenal to bargaining with principals or interest groups. Indeed, almost all empirical studies of rulemaking discard unsophisticated comments from ordinary people, as evident from a comprehensive review of "The Politics of Rulemaking" by Yackee (2018), which finds skepticism about citizen comments but no direct studies of mass comment campaigns.

Despite the skepticism assumed by scholars, Yackee (2015) finds that ordinary participants strongly believe that their comments matter, even if they see businesses as more influential. Without systematic understanding and study of public participation, it is difficult to adjudicate debates about how processes like notice and comment rulemaking may enhance or undermine various democratic ideals.

This scholarly oversight is surprising given that most people are only aware of rulemaking when it is the target of a high-profile mass mobilization campaign.[4] While most rules receive little attention, the ease of online mobilizing and commenting has, like other forms of participation (Boulianne 2018), created exponential increases in the number of rules in which thousands and even millions of people engage (see figure 2; note that comments per rule are on a logarithmic scale).[5] Occasionally, a large number of people are paying attention.

The general failure to explain or account for mass engagement in rulemaking is also striking in light of how agencies advertise public comment periods as an opportunity for a voice in government decisions.[6] Big red letters across the top of the Regulations.gov homepage solicit visitors to "Make a difference. Submit your comments and let your voice be heard" (Figure 1). A blue "Comment Now!" button accompanies a short description of each draft policy and pending agency action. Another invitation at the bottom of the page reads "Participate today!" Public commenting on proposed agency rules is described as "an important part of democracy" (WSJ 2017), the "purest example of participatory democracy in actual American governance" (Herz 2016). Rossi (1997) finds that "courts, Congress,

---

[4]Some of the most contentious recent public controversies involve bureaucratic policymaking. For example, along with 50 thousand protesters in Washington D.C., the State Department Received 1.2 million comments on the Environmental Impact Statement for the Keystone Pipeline. Similarly, along with the thousands of protesters supporting the Standing Rock Sioux protest to the Dakota Access Pipeline, the Army Corps of Engineers received hundreds of thousands of comments. Alongside protest actions that included shutting down many websites, the Federal Communications Commission's open internet rule received 22 million comments. While some of these comments appear to be fake, the scale of public engagement is remarkable given how little attention political scientists have paid to it. Fake public comments also raise the question of why an organization would bother to generate fake public input if it did not matter, as its omission from theories of bureaucratic policymaking would seem to imply.

[5]Proposed rules that have attracted the most public attention have been published by the Federal Communications Commission (FCC, omitted from this plot), the Environmental Protection Agency (EPA), the Department of Interior (DOI), the Bureau of Ocean Energy Management (BOEM), the Consumer Financial Protection Bureau (CFPB), and Fish and Wildlife Service (FWS).

[6] I focus on public comments in rulemaking, but my theory and methods also apply to other kinds of political engagement such as through social media or protests as well as to other political decisions, including state-level rulemaking. Social media engagement may be especially important if agencies implement the recommendations of ACUS (2018) that "Agencies should consider using social media before or in connection with direct final rulemaking to quickly identify whether there are significant or meaningful objections" (p. 34).

Figure 1: Regulations.gov Solicits Public Comments on Draft Agency Rules

Figure 2: Comments on Proposed Rules per Year (left) and per Rule (right) posted on regulations.gov

and scholars have elevated participation [in rulemaking] to a sacrosanct status...greater participation is generally viewed as contributing to the democracy." Yet despite much debate about the theoretical import and possible reforms, the bulk of public comments have yet to be studied.

Most public comments are, in fact, of the flavor suggested by the solicitations on Regulation.gov—ordinary people voicing opinions on a proposed policy. They do not provide useful technical information or specific demands like the interest group comments that have thus far captured the attention of political scientists. They are also highly clustered on a few salient rules. Arguably, thousands of people engaging on a few proposed policies may alter the politics of these rules, both theoretically and empirically.

The kind of politics created by mass engagement has a few notable features. It is contentious; most ordinary people are not engaging in deliberation, they are simply making demands. However, processes like public comment periods channel contentious demands into institutionalized policy processes rather than undermining them. Mass commenting may also, in a sense, expand participation.[7] Surely, those who opt in are far from representative of the broader public (Verba and Nie 1987), but it is difficult to argue that they are not more representative than the handful of political insiders who participate in most policy processes. If the usual participants have "an upper-class accent" as Schattschneider (1942)

---

[7] Defining "political participation" as "acts aimed at influencing governmental decisions (Verba and Nie 1987: p. 2), signing a mass comment clearly counts. However, some consider true participation to be deliberative, which mass commenting clearly is not. Other requirements, that participation is "genuine," "informed," or "reasoned" are more difficult to assess.

put it, adding thousands more voices may dilute this bias. Mass engagement in rulemaking thus presents an novel context to examine the consequences of broader engagement in typically insider-dominated policymaking and the ways in which participation may condition how political decisions are made.

In contrast to political scientists, legal scholars have long debated what to make of mass commenting in rulemaking. Many focus on reforms to help agencies collect more useful information (Farina et al. 2011; Farina, Newhart and Heidt 2014; Rauch 2016). In 2018, "Public engagement" was main project of the Administrative Conference of the United States (ACUS) committee on Rulemaking: The project

> "explores agency strategies to enhance public engagement prior to and during informal rule-
> making. It seeks to ensure that agencies invest resources in a way that maximizes the proba-
> bility that rulewriters obtain high-quality public information."

Among other things, this committee is debating how best to gather "quality public information," how "to get new people/groups into the real or virtual room" (Farina 2018), and whether broad engagement is even desirable on all rules (White 2018). Administrative law scholars have explored these questions theoretically for decades, but only a few offer empirical analysis. Mendelson (2011) finds that agencies often discard non-technical comments but argues that they should be given more weight. Others worry that mass commenting distracts agencies from good policy and the broader public interest (Coglianese 2006). Farina et al. (2012: p. 112) claims that "[Mass] comments typically are neither factually informative nor reliable indicators of citizens informed value preferences." Some even call them "spam" (Balla et al. 2018). In this prevailing view, "high-quality" and "relevant" mean novel technical information, not opinions. Herz (2016: p. 208) concludes "The goal of e-rulemaking is to more fully capture such credible, specific, and relevant information, not to solicit the views of random, self-nominating members of the public." Similarly, Epstein, Heidt and Farina (2014: p. 4) dismiss mass comments as "effectively, votes rather than informational or analytical contributions. Rulemaking agencies are legally required to make policy decisions based on fact-based, reasoned analysis rather than majority sentiment; hence, even hundreds of thousands of such comments have little value in the rulemaking process."

Early optimism among legal scholars that the internet would "change everything" (Johnson 1998) and that "cyberdemocracy" would enable more deliberative rulemaking has faded. While commenting and mobilizing others to comment has become easier, Coglianese (2006) finds that little else has changed. The prediction that the internet would primarily facilitate more of the same kind of engagement among the like-minded (i.e. mass-commenting) (Sunstein 2001) has largely been correct. In this sense, the "quality" of discourse has not improved.

Even scholars who suggest reforms aimed at "regulatory democracy" aim to increase the "sophisti-cation" of ordinary peoples' comments (Cuéllar 2014; Johnson 2013). Notably, the ACUS draft recom-mendations on "Mass and Fake Comments in Agency Rulemaking" suggests that "effective comments" give "reasons rather than just reactions" (ACUS 2018: p. 33). If true, most public reactions to proposed

rules such as those expressed in mass comments would have no effect in rulemaking.

While this scholarship has improved the theory and practice of policy learning in rulemaking, focusing on sophisticated deliberation and technical information overlooks the potential role of political information.[8]

2   Theory

Incorporating mass engagement into theories of bureaucratic policymaking.   How, if at all, should scholars incorporate mass engagement into models of bureaucratic policymaking? I argue that mass engagement produces potentially valuable political information about the coalition that mobilized it. Thus, depending on how agencies process political information, "going public" may occasionally be an effective strategy for organizations to influence policy, both directly and indirectly. However, influencing policy may not be the only reason to mobilize.

The next section builds a causal theory. I theorize that activists' opportunities and strategies and latent public opinion drive engagement.

The following section outlines methodologies to assess my three overarching questions and their component parts. Theses methods rely on analysis of comment and policy texts as large-n observational data.

2.1   Why mobilize?

Why do people comment on draft policies when they seem to have no new information to offer and no power to influence decisions? Who inspires them and to what end?

Answering these questions requires a theory explaining variation in mass engagement. This section defines mass engagement and theorizes that we should observe different patterns of engagement depending on whether an organization launches a mobilization campaign as an outside lobbying tactic, to counter such a campaign, or for reasons other than influencing policy. In the next section, I develop methods to measure these patterns. In short, these measures capture similar statistics to questions posed by Verba and Nie (1987: p. 9): "How much participation is there, what kind is it, and from what segments of society does it come?" I hypothesize that different segments of society have different reasons for participating and thus participated with different frequency and different types.

A growing literature in political science draws on scholarship in law and public administration as well as studies of agenda setting and lobbying in legislative policymaking to better understand agencies as policymaking bodies. Public administration and legal scholars have been more attentive to the prominent role of interest groups. Kerwin and Furlong (2011) notes that "Interest groups could find

---

[8]But see the below review of insights from Golden (1998), Nelson and Yackee (2012), and Rauch (2016) on political information and Reich (1966) and Seifter (2016) on representation.

few modes of government decision making better suited to their particular strengths than rulemaking."
This research finds business groups to be the most successful class of commenters in rulemaking (Yackee
and Yackee 2006) especially when lobbying together, often, or unopposed (Nelson and Yackee 2012) and
when lobbying across multiple venues (Yackee 2015). Importantly, this literature notes that the currency
of lobbying is information (Hall and Deardorff 2006; Carpenter, Esterling and Lazer 1998; Yackee 2006),
which includes both science and policy ideas (Jones and Baumgartner 2005). Kirilenko, Mankad and
Michailidis (2014) and Yackee and Yackee (2006) both find evidence that comments from sophisticated
interest groups like businesses seem to influence rules. Yackee and Yackee (2006) theorize several mech-
anisms of influence, including bringing in new voices and sending unified messages at higher amplitudes,
creating perceptions of political consensus.

However, as noted above, scholars of bureaucratic policymaking have focused on the sophisticated
lobbying efforts of powerful interest groups such as business coalitions. A key insight from this scholarship
is that technical information is the currency of insider lobbying. Figure 3 illustrates the classic causal
model of insider lobbying that describes most rulemakings. However, mass engagement has no place in
this model. I aim to fill this gap.

Figure 3: The Classic Model of Interest Group Lobbying in Bureaucratic Policymaking
2.1.1   Defining mass engagement

Political scientists often define civic engagement as writing to government officials, signing peti-
tions, attending hearings, attending protests, or donate to a political campaign (Verba and Nie
1987). While donating is more common in electoral politics, activists frequently target agency
policymaking with letter-writing campaigns, petitions, hearings, and protests.

Following the conventional terms "mass comment campaign" and "public engagement," I call
the general phenomenon "mass engagement" resulting from a "mass mobilization campaign"
in order to distinguish the magnitude of civic engagement. By mass engagement, I mean that
thousands of people beyond professional policy influencers engage. Specifically, I define mass
engagement as more than 1000 public comments or 100 identical comments, plausibly reflecting
a mobilization effort.

Contrary to the common assumption that this emerges organically, it is almost always mo-
bilized by an organization that also engages in sophisticated lobbying. As Sant'Ambrogio and

Staszewski (2018) conclude "The 'mass comments' occasionally submitted in great volume in highly salient rulemakings are one of the more vexing challenges facing agencies in recent years. These comments are typically the result of orchestrated campaigns by advocacy groups to persuade members or other like-minded individuals to express support for or opposition to an agency's proposed rule." To better understand this vexing challenge, I offer a framework for assessing the causes of mass engagement. I argue that organizations may mobilize large numbers of people for three reasons with observable implications for observed patterns of mass engagement and theoretical implications for predicted effects on policy.

2.1.2   Types of campaigns

The outcomes of mass mobilization depend, in part, on the aims of a campaign. Campaigns may have one of three distinct aims: (1) to win concessions by going public, (2) to disrupt a perceived consensus, or (3) to go down fighting. Going public and disrupting a perceived consensus are forms of outside lobbying, the former proactive, the later reactive. Going down fighting describes a situation where the organization does not expect to influence policy but mobilizes for other reasons.

Going public. Coalitions "go public" when they believe that expanding the scope of conflict gives them an advantage.[9] As these are the coalitions that believe they have more intense public support[10], many people may be inspired indirectly and to engage with more effort. In these cases, mass engagement is likely to skew heavily toward this side. This is important because a perceived consensus may be especially influential political information.[11]

Hypothesis 1a: *Lobbying coalitions mobilize mass engagement when they perceive that the attentive public is on their side, have sufficient resources, and perceive an opportunity to influence policy.*

Disrupting a perceived consensus. Second, because the perception of consensus is powerful, when a coalition goes public, an opposing coalition may countermobilize. As this is likely a

---

[9] "Going public," "outside lobbying" or an "outside strategy" contrasts with insider lobbying. It is used by Presidents (Kernell 2007), Members of Congress (Malecha and Reagan 2012), interest groups (Walker 1991; Dür and Mateo 2013), Lawyers, and Judges (Davis 2011). For example, organizations may use phone banks, targeting strategies, and direct-mail techniques to drum-up and channel public support (Cooper 1985).

[10] This strategy is likely to be used by those disadvantaged (those Schattschneider (1975) calls the 'losers') with less public attention. Rulemaking with little public attention is the norm and nearly all scholarship on rulemaking in political science thus focuses on interest-group and inter-branch bargaining, ignoring public opinion and social movements.

[11] For example, consensus among interest groups (Golden 1998; Yackee 2006), especially business unity (Yackee and Yackee 2006; Haeder and Yackee 2015), predicts policy change, though it is not clear if this is a result of strategic calculation, a perceived obligation due to the normative power of consensus (e.g. following a majoritarian (Mendelson 2011)), or simply that the information is easier to process.

coalition with less intense public support and its aim is merely to break a perceived consensus, I expect such campaigns to engage fewer people, less effort per person, and yield a smaller portion of indirect engagement.

Hypothesis 1b: *When a lobbying coalition with more intense public support mobilizes successfully in response to an opportunity to influence policy, opposing coalitions with less public support are more likely to counter-mobilize, but at a proportionally smaller scale.*

Going down fighting. Finally, campaigns may target supporters rather than policymakers. Sometimes organizations "go down fighting" to fulfill supporters' expectations. I use "going down fighting" as shorthand for campaigns aimed at only at fulfilling member, donor, or supporter expectations and related logics that are internal to the organization, including member retention or recruitment, fundraising, or satisfying a board of directors. For example, as Figure 4 shows, the Sierra Club uses campaigns to collect contact information of supporters and potential members. In this case, given the executive-branch transition between 2010 when the rule was initiated and 2017 when it was delayed, the Sierra Club may have had little hope of protecting methane pollution standards, but for members of the public who wanted to register their opinion, the Sierra Club created an easy way to do so, if users consent to "receive periodic communication from the Sierra Club."

While such campaigns may engage many people, they are unlikely to affect policy or to inspire countermobilization. I expect such campaigns to occur on rules that have high partisan salience (e.g. rules following major legislation passed on a narrow vote), rules that propose large shifts on policy issues dear to well-funded public interest groups, or rules that begun shortly after presidential transitions when executive-branch agendas shift more quickly than public opinion.

Hypothesis 1c: *When a lobbying coalition with more intense public support successfully mobilizes for reasons other than influencing policy, opposing coalitions with less public support are not more likely to counter-mobilize.*

Going public and going down fighting may be difficult to in the observed public response. Indeed, members of the public may poorly understand the chances of success. However, groups do likely know their chances of success and will thus invest less in sophisticated insider lobbying under the going down fighting strategy. Table 2.1.2 specifies the general pattern of engaging, that each of the three reasons behind mass-comment campaigns suggests.

While coalitions may form around various material and ideological conflicts, those most likely to be advantaged by going public or going down fighting are public interest groups—organizations

Figure 4: Mass mobilization campaign by the Sierra Club collects contact information

Table 1: Observable differences in engagement across types of mass-mobilization campaigns

	Inside	Outside		
	Technical information	Number of comments	Effort	Contagion
Going public	High	High	High	High
Disrupting	High	Low	Low	Low
Going down fighting	Low	High	High	High

primarily serving an idea of the public good rather than the material interests of their members.[12] Thus, I theorize that mass mobilization is most likely to occur in conflicts of public versus private interests or public versus public interests (i.e. between coalitions led by groups with distinct cultural ideals or ideas of the public good), provided they have sufficient resources to run a campaign.[13]

---

[12]Berry (1999) calls these groups "citizen groups" and emphasizes conflict over cultural issues. While some of these groups focus on conservative or progressive cultural issues, like religious education or endangered species, many are more focused on the public provision or protection of public goods such as national parks, consumer product safety standards, air quality, and drinking water, and public safety.

One exception may be the few types of membership organizations that are both broad and focused on material outcomes for their members such as labor unions.

[13] If true, one implication is that mass mobilization will systematically run counter to concentrated business interests where they conflict with the values of organized, privileged groups.

Hypothesis 1d: *Public interest group coalitions mobilize more often than business-driven coalitions.*

This hypothesis highlight the conditional logic of mass mobilization. If outside lobbying were purely determined by resources, business-driven coalitions would often dominate, as they do elsewhere. However, because outside lobbying alters the decision environment, those advantaged by the usual, more limited set of actors have little incentive to expand the scope of the conflict.

2.1.3 Patterns of mass engagement

I classify supporters into three types based on how they were mobilized. Comments that are exact copies of a form letter are akin to petition signatures from supporters who were engaged by a campaign to comment with minimal effort. Commenters that also take time to add their own text indicate more intense preferences. Finally, commenters who express solidarity in similar but distinct phrases indicate they were engaged indirectly, perhaps by a news story or a social media post about the campaign, as campaign messages spread beyond those originally targeted. Because the success of a mobilization effort is moderated by public support, broader public interest group coalitions ought to mobilize more people, more effort per person, and more people indirectly for the same amount of mobilization effort (e.g. spending or solicitations).

Hypothesis 1e: *Public interest group coalitions mobilize more successfully than business-driven coalitions. Indicators of success include (1) the number of comments supporting a coalition (2) the effort per comment (3) the number of comments mobilized indirectly.*

The size of each group thus offers political information to policymakers, including coalition resources, the intensity of sentiment, and potential for conflict to spread. The first two types signal two kinds of intensity or resolve. First, they show the mobilizers' willingness to commit resources to the issue. Second, costly actions show the intensity of opinions among the mobilized segment of the public (Dunleavy 1991). The number of people engaged by a campaign is not strictly proportional to an organizations investment. The less each person care, the more it costs to mobilize them. The third type indicates potential contagion. Indications that messages spread beyond those originally targeted may be especially powerful (Kollman 1998).

Information about organizational resolve, the intensity of preference, and contagiousness are thus produced, butsuch political information will only influence decisions if these signals are processed in a way that captures this information and relays it to decisionmakers. These organizational processes may vary significantly across agencies.

2.1.4   Incorporating political information into models of lobbying in rulemaking

When lobbying during rulemaking, groups often make suspect claims to represent broad segments of the public (Seifter 2016). If agency staff do not trust an organizations' representational claims, engaging actual people may be one of the few credible signals of a broad base of support. Appeals to the government are almost always couched in the language of public interest, even when true motivations obviously private (Schattschneider 1975). Theorists may debate whether effectively signing a petition of support without having a role in crafting the appeal is a meaningful voice and whether petitions effectively channel public interests, but, at a minimum, engaging a large number of supporters helps distinguish broader interests from truly narrower ones. It suggests the organization is not "memberless" (Skocpol 2003) in the sense that they are able to demonstrate some verifiable public support.[14]

Mass mobilization is a strategy. When successful, mass engagement is the result. An organization's ability to expand the scope of conflict by mobilizing members of the public may occasionally be a valuable political resource. In contrast to scholars who focus on the deliberative potential of public comment processes, I focus on public engagement as a tactic aimed at gaining power, either by leveraging powerful ideas or engaging actors with the institutional power to shape decisions. Scholars who do understand mobilization as a tactic (Furlong 1997; Kerwin and Furlong 2011) have thus far focused organizations mobilizing their membership. I include a campaign's broader audience and its potential to grow, more akin to the concept of an attentive public (Key 1961) or issue public (Converse 1964). If organizations claim to represent people beyond their official members, reforms requiring groups to disclose information about their funding and membership (Seifter 2016) only go part way to assess groups' claims to represent these broader segments of the public. Indeed, if advocacy group decisions are largely made by D.C. professionals, these advocates themselves may be unsure how broadly their claims resonate until potentially-attentive publics are actually engaged.

Here I build on three insights. First, Kerwin and Furlong (2011) and Furlong (1997) identify mobilization as a tactic. In their survey, organizations report that forming coalitions and mobilizing large numbers of people are among the most effective lobbying tactics. Second, Nelson and Yackee (2012) identify political information a potentially influential result of lobbying by different business coalitions. While they focus on mobilizing experts, Nelson and Yackee (2012) describe a dynamic that can be extended to mass commenting:

---

[14] Public support can be faked or inflated using "astroturf" tactics but as I argue below, such campaigns ought to have observably different patterns of engagement.

"strategic recruitment, we theorize, mobilizes new actors to participate in the policy-making process, bringing with them novel technical and political information. In other words, when an expanded strategy is employed, leaders activate individuals and organizations to participate in the policymaking process who, without the coordinating efforts of the leaders, would otherwise not lobby. This activation is important because it implies that coalition lobbying can generate new information and new actors—beyond simply the 'usual suspects'—relevant to policy decision makers. Thus, we theorize consensus, coalition size, and composition matter to policy change."

I argue that, with respect to political information, this logic extends to non-experts. The number of and distribution of ordinary supporters also matters because it suggests a *public* consensus. Instead of bolstering scientific claims, a perceived public consensus bolsters political claims. Third, Furlong (1998), Yackee (2006), and others distinguish direct and indirect forms interest group influence in rulemaking. I argue that mass mobilization is a tactic aimed at producing political information.

Rauch (2016) suggests that agencies reform the public comment process to include opinion polls. I build from a similar intuition that mass comment campaigns currently function like a poll or, more accurately, a petition, capturing the intensity of preferences among a segment of the public—i.e. how many people are willing to take the time to engage.[15] Self-selection may not be ideal for representation, but opt-in participation—whether voting, attending a hearing, or writing a comment—still provides political information. Mobilizing citizens and generating new political information are key functions of interest groups in a democracy (Mansbridge 1992; Mahoney 2007). The information generated by mass mobilization campaigns is explicitly political and more complex than an opinion poll. Activists aim to convince people which issues are important and how to think about them—mapping new issues and debates to familiar ones, thereby shifting the political landscape.

Importantly, rule-specific campaigns inform agencies about the distribution and intensity of opinions that are often too nuanced to estimate a priori. Many rules may lack analogous public opinion polling questions, making mass commenting a unique source of political information. Indeed, as is true about public opinion on many specific policy issues (Hutchings 2003), most members of the public and their elected representatives may only learn about the issue as a result of a mobilization campaign. I thus consider public demands to be a latent factor in my

---

[15] For example, a campaign by the World Wildlife Federation provided language explicitly claiming to have public opinion on their side, their model comment reading "Along with 80% of the American people, I strongly support ending commercial trade in elephant ivory in the US." This suggests that mass comment campaigns aim to signal information about public opinion.

model of policymaking. Public demands shape the decisions of groups who lobby in rulemaking. If they believe the attentive public is on their side, groups may attempt to reveal this political information to policymakers by launching a mass mobilization campaign. The public response to the campaign depends on the extent that the attentive public is passionate about the issue.

Figure 5 amends the classic model of interest group lobbying to incorporate the above intuitions. In addition to providing technical information, for example through sophisticated comments, an organization may mobilize supporters. The broader and more intense support the group has, the more successful this effort will be. Large-scale engagement may produce several types of relevant political information. The most direct and obvious is the expressed "public opinion" that policymakers observe.[16]

Figure 5: Incorporating Mass Engagement and Political Information into Models of Lobbying
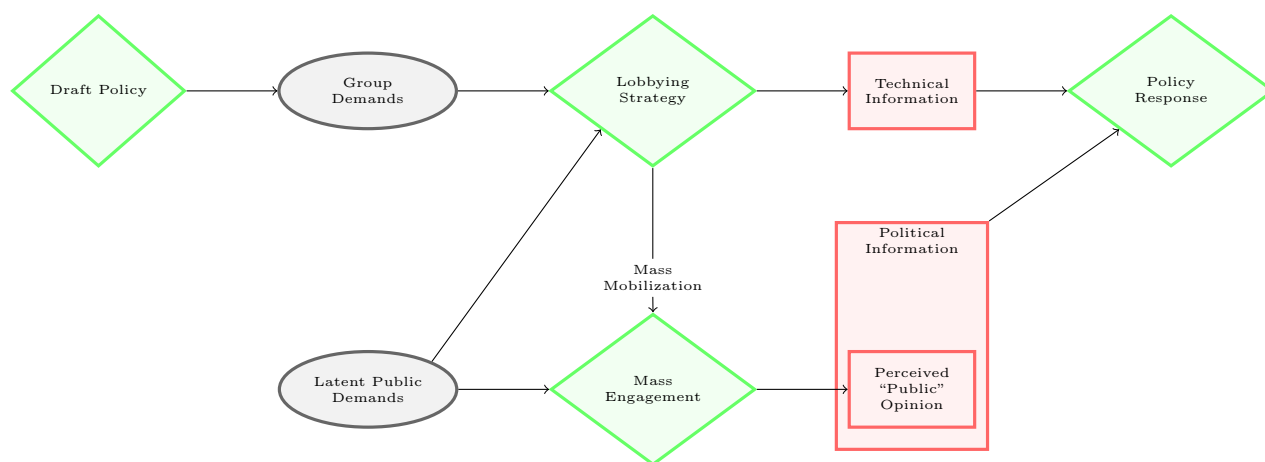

The causal process visualized in figure 5 only operates under certain conditions. As suggested above, one of those conditions is that mobilization was aimed at influencing policy.

3   Methods

3.1   Measuring mass engagement and political information

In this section, I develop methods to attribute mass comments to the campaigns that mobilized them and measure the intensity of preferences expressed. To link individual comments to the more sophisticated lobbying efforts they support, I use text reuse and topic models to identify clusters of similar comments, reflecting formal and informal coalitions. Comments with identical

---

[16]I address other types of political information that mass engagement may create elsewhere. For an expanded model, see Figure 9 in the Appendix.

text indicate which groups and coalitions also chose to run a mass comment campaign. Within each campaign, I measure the intensity and potential for the movement to grow. To measure intensity, I examine the ratio of high-effort and low-effort comments. To measure potential to grow, I measure the number of comments mobilized indirectly by the campaign. The result is several new measures that paint a picture of mass commenting. Using these new measures of public engagement in agency rulemaking, I identify the conditions under which it occurs and produces different politically-relevant information.

3.1.1 Who lobbies?

Previous studies of rulemaking stress the importance of coalitions (Yackee and Yackee 2006). Scholars have measured coalitions of organized groups but have yet to be able to attribute citizen comments to the coalition that mobilized them. Unfortunately, metadata on the authors of comments are often inconsistent and incomplete. As this information is key to identifying influential actors, improving these data is a significant data-organization task. I have collected a corpus of over 70 million comments on over 300,000 proposed rules. The first task will be linking these comments to other data on the rules.

Text search matching organization and individual names across texts, especially those named as comment authors will help systematically link individuals to the groups that mobilized them.This helps to identify formal coalitions of organizations that sign onto the same comment as well as experts and citizens mobilized by advocacy campaigns to submit separate comments.

Having identified who is participating in rulemaking, the next step is to identify who is lobbying together.

3.1.2 Who lobbies together?

The Oceana coalition framed its mass mobilization effort to curb the Bureau of Ocean Energy Management's 2017 Proposed Offshore Oil and Gas Leasing Program as a "petition signed by 67,275 self-proclaimed United States residents," suggesting that organizations consider these efforts as akin to petitions. In the same statement, Oceana also claimed the support of "more than 110 East Coast municipalities, 100 Members of Congress, 750 state and local elected officials, and 1,100 business interests, all of whom oppose offshore drilling," suggesting that claims of public and elected official support aim to provide similar kinds of political information.

When actors sign onto the same comment, it is clear that they are lobbying together. This generally takes two forms. Businesses and groups representing allied industries often co-sign

carefully crafted suggestions that reflect their common interest. We expect this to occur when the benefits of coordination outweigh the costs (Yackee and Yackee 2006). The other form this take is public campaigns that ask citizens to submit a form letter, often alongside other actions such as protests. These occasional bursts of civic participation may affect rulemaking (Coglianese 2001), but this is yet to be tested. In the first form, many of the businesses are repeat players and I record them individually. In the second form, the advocacy groups are repeat players, and I recorded their participation, but it would be citizens who participate are likely not and I record the number of these comments as an amplitude parameter for the text they signed and I attribute form-letter texts to the advocacy groups promoting them.

Various businesses, advocacy groups, and citizens often comment separately even when they aligned. The comment process is open to anyone and it is often not worthwhile for all actors to coordinate their messages. There may be many dimensions of demands and it is unclear to which coalition many comments belong.

In addition to mapping text re-use, I adapt several statistical models (Bayesian classifiers) of text to classify comments into coalitions. Classifying comments into common groups is a task well suited for a single membership topic model.[17]. This model clusters documents by the frequency with which they use different words. Being classified together does not mean that the documents all address exactly the same distribution of substantive issues, just that how issues are discussed is similar relative to the full set of documents. I start by modeling all comments on each rule (collapsing exactly identical comments to one document) with three topics, which I will then inspect to see how well the comments of named organizations were classified. If three topics appear to sensibly describe the conflict, I tag these topics as "pro, con, other."

In terms of the causal process theorized above, this section focuses on measuring and explaining organizations' lobbying choices (i.e. to only provide technical information or to also mobilize) and public response to mobilization campaigns (the frequency and effort with which people engage). The key explanatory variable is public support for the campaign. The bold arrows in figure 6 indicate the relationships of interest for this step.

---

[17] This is in contrast to the mixture model I use to estimate the distribution of multiple topics in each document and each coalition in section ??

Figure 6: Step 1: Explaining Mass Mobilization and Mass Engagement
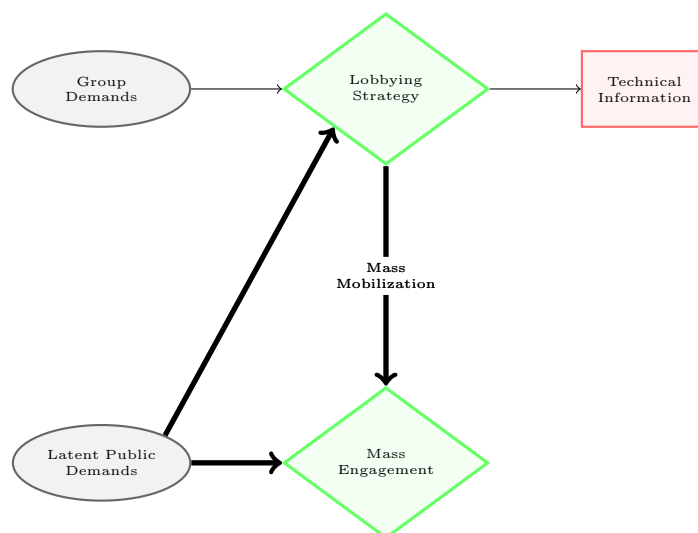

3.1.3   Measuring the volume, intensity, and potential contagion of public engagement.

I argue that activists' opportunities and strategies explain variation in engagement, which I measure in several ways.

Volume.   First, I measure the total number of comments on the rule. As commenting are the results of two processes: deciding to lobby at all and then deciding to mobilize, the distribution contains many cases where groups may have had success mobilizing but never reached the choice of whether to mobilize or not. Perhaps they were unaware of the draft rule. Once the decision to mobilize has been reached and made, the result of mobilizing is a count process. Thus, the count of comments fits a zero-inflated negative binomial distribution. When focusing on coalitions, we have already subset to cases where mobilization occurred and thus commenting can now be considered a regular count process.

Effort.   Effort per comment is a continuous measure of the of the number of words people write, omitting any to text longer than 10 words provided by a mobilizing organization. For example, using the form shown in 4, the Sierra Club mobilized more than 47,710 people to submit exactly the same text on the delay of the methane pollution rule, but 7,452 people also took the time to write a personalized comment in addition to the form letter text. However, we may not observe people who have low levels of passion for the issue because they either do not cross the effort threshold required to comment or opt to write nothing more than the form letter. Thus the low end of the distribution of words is truncated.

Figure 7: Unique vs Form-letter Comments Posted to Regulations.gov 2006-2018
Contagion. Mass-comment campaigns have wildly different results. Some gather a clean 10,000 copies of (or, more accurately, signatures on) the same comment and call their work done. Others "go viral"—inspiring a mess of further engagement where the original messages are translated through social media posts and news stories. Finally, I count the number of people who use fewer than 10 words matching an organizational comment, plausibly those who were mobilized indirectly, another regular count process.

4   Patterns of public engagement in rulemaking

In this section, I present the results of applying the classification methods described above.

Data. In his case-study of several rules, Cuéllar (2005) finds that "contrary to conventional wisdom, comments from the lay public make up the vast majority of total comments about some regulations. This shows at least some potential demand among the mass public for a seat at the table in the regulatory process." With over 70 million comments on over 300,000 proposed rules, I am able to offer a much more systematic analysis.

Most comments result from mass-comment campaigns. Figure 7 shows all comments posted on regulations.gov over time by whether they are exact copies of another comment or not. This highly restrictive definition of what counts as mass engagement captures comments that were certainly mobilized by a campaign. As 7 shows the vast majority of comments are mobilized by mass commenting campaigns. In other words, most comments are from ordinary people.

The right pane of 7 shows results from a sample of several million comments for which I have

Figure 8: Top 10 Dockets Receiving the Most Comments on regulations.gov and the 20 Mobilizers
digitized texts. Many of these comments appear to support proposed agency rules, as was the case with both the do not call and mercury rule examples. A rough measure of support (whether the comment text includes " support " or " oppose ") shows that many more comments mention support, until 2018, when there is a fairly dramatic reversal in the share of comments mentioning " support " compared to those mentioning ' 'oppose " (figure 7). This may be a function of the changing regulatory agenda due to the change in presidential administration.

Most comments occur on a small number of salient rules. Approximately a third of public comments posted to regulations.gov were received on just ten dockets.

A coalition of public-interest organizations mobilize most comments. As figures 8 shows, the most prolific mobilizers are environmental groups. On 5 out of the top 10 dockets, a similar coalition of groups mobilized the majority of pubic comments. In part, this is because the Environmental Protection Agency produces a large share of substantive rules posted to regulations.gov. However, it is notable that, on the top ten dockets, 19 of the top 20 mobilizers generally lobby together. America's Energy Cooperatives, an industry association, stands out as the lone mobilizer on behalf of material interest for its members. Notably, it only mobilized significantly on the Clean Power Plan.

5   Conclusion

If input solicited from ordinary people has little effect on policy outcomes, directly or indirectly, it may be best understood as providing a veneer of democratic legitimacy on an essentially technocratic and/or elite-driven process. The legitimacy of bureaucratic policymaking is said to depend on the premise that rulemaking provides an outlet for public voice (Croley 2003; Rosenbloom 2003). Yet, it is not just the opportunity to engage, but actual engagement that matters (Herz 2018), and we lack an empirical base necessary to evaluate whether any legitimacy the public comment process may provide is deserved, even if people believe that their comments matter (Yackee 2014). If mass engagement does shape agency decisions, a new research program will be needed to investigate who exactly these campaigns mobilize and represent.
